## Sync mobile bookmarks to desktop chrome

Read this article to learn how to sync Google Chrome bookmarks and history between your computer and mobile devices on Android or iOS.Contents: Customize and manage your synced data. Personal computers.« Android » and «iOS» Devices.ConclusionIntroductionWith one account you can access most of the google services, such as Google Ads, «Gmail» and «YouTube», and after you create an account in only one of them, you can start using all others. In your newly created Google Account, you can store all the information and use it as you think it is suitable for desktops and laptops, mobile devices, communicators, and camera phones - provided that the disk space of all these devices is connected on a single platform. One of the tools to give access to «Internet Resources» and one to work with all devices is the bookmarks panel «Google Chrome» browser, which contains all the sites saved by the user - and this list is the same for all devices. If the scope of the data you're going to use is much wider and includes information other than tags, you can use sync to combine data into a single database that can be accessed from both desktop and mobile devices. In this article, we will show you in detail how to quickly enable, add or disable bookmarks «Google Chrome», and how to synchronize them with other data (e.g. browsing history, passwords, autofill data, etc.) between various computer devices running popular operating systems (Windows) , «Android» and «iOS»). How to show, configure, and hide bookmarks in «Google Chrome». People use «Internet» all the time for a variety of purposes, from simple search queries to the transmission of important information and critical projects for remote control. In 2005, people are looking for answers to their questions and solving specific tasks, but also regularly visit certain «web resources» directly related to their professional, business or other interests, or those used for communication and entertainment. In most cases, the group of websites you visit is the same, so users can save the addresses of such resources with bookmarks to save time and improve the user experience, as they can very quickly switch to a specific resource. Turning on bookmarks in Google Chrome is quite simple - just follow a few steps below. The Google Chrome interface is very minimalist, so it doesn't distract the user from what appears in the current tab, so most bookmarks are hidden by default. However, the bookmarks panel is not going to mess up the Google Chrome page, and it can improve the convenience of use greatly, especially if there are so many sites marked by the user. Open «Google Chrome» and look at the upper right corner of the screen, click on the button «Customize and manage Google Chrome» with vertical points. In the context menu that appears, point to the «Bookmarks» line and wait for the menu to appear: select Show Bookmark Bar». bar». make the bar visible by using keyboard shortcuts «Ctrl+Shift+B» (Windows) or «Command + Shift + B» («MacOS»). The bookmarks bar will appear directly below the address bar and all saved webpages will be displayed. However, if you don't want to see the bookmarks bar while browsing, you can turn it off by doing the same, in reverse order. Either form a settings menu or use keyboard shortcuts to make Google Chrome look minimalist again.« Google Chrome settings allow you not only to create new bookmarks, but also to import previously saved bookmarks from other web browsers in various formats. Go to «Google Chrome» settings menu under «Bookmarks» and select «Import bookmarks and settings». On the new page you will be offered to import bookmarks from default browsers in the «Windows» operating system (Microsoft Edge and «Microsoft Internet Explorer») and from the «HTML file» previously created in any other browser. Click «Select file» and search for the file for the tags you are importing. Tags and user settings are now available on Google Chrome. How to synchronize bookmarks between pc, «Android» and «iOS» devices.How to enable or disable synchronization «Google Chrome». With a single Google Chrome account, you can save data and access it from any computer device. The primary requirement is to enable synchronization. It's hard to overstate the benefits of using this mode because you're in sync because of some real benefits: All synced user data, including tags, passwords, browsing history, and other information, will be available on all devices, and users will be able to update this information from any device. Automatic login to «Google» services such as «Search», «Gmail», «YouTube», «Google Drive», «Google Photos» becomes possible. When you switch to another computer device (desktop or mobile device), user data becomes available as soon as you sign in to your Google Account. If you enable your browsing history and search history, Google Chrome will save and use information about all actions to personalize your services. This allows you to enable synchronization of computer devices running different operating systems. Personal Computers.To enable synchronization in Google Chrome, you must have a valid «Google» account. On your computer, open Google Chrome, and in the upper-right corner of the screen, next to the address bar, click «current user». You will be prompted to turn on sync by pressing the appropriate button. To get started, you just need to sign in to your account. Enter the phone number or email address you used to create your account, and click «Next». Now enter your password to confirm your login to your account, and click «Next» again. After all, Google Chrome will show you a pop-up window «Enable where you need to click «Yes, I'm in!» to finally enable synchronization. If you ever need to turn off sync, you can still see bookmarks, browsing history, payment methods, and other data on your computer. However, if you make any changes, they won't be saved in your Google Account and won't sync with other connected devices. If you turn off syncing, this also means disconnecting from other Google services, such as Gmail or «Photos». To turn off sync, open Google Chrome again and click the Customize and manage Google Chrome button next to the address bar and look like three vertical dots. In the context menu that appears, select «Settings». On this page, find the «People» tab and click «Disable». Confirm your decision to disable sync in a pop-up message by clicking «Disable» again and the synchronization will stop. Android and iOS devices. The synchronization mode procedure for disabling and disabling mobile devices running «Android» or «iOS» is almost identical and works correctly on both operating systems. Note. Use a previously created «Google» account to enable this mode. On your Android mobile device (phone or tablet) or on an iOS device («iPhone» or «iPad»), open Google Chrome. If you do not have this app on a specific device, download it from «Google Play» or «App Store» respectively, then install it before proceeding. In the upper-right corner of the screen, tap the button with three vertical dots to access the Google Chrome controls. Select «Settings» from the menu that appears. On the Settings page, tap Sign in to Chrome (it's at the top of the screen). On the Google page, select the user name you want from the list (a selection mark will appear next to it) and tap Continue. On the welcome page, when informing you about user identification, «Chrome» synchronization is enabled and personalized by The Google Services, tap «OK» to finish. Now «Chrome» synchronization with the selected «Google» account on your mobile device is complete. When Chrome sync is turned off, bookmarks, history, recent tabs, and other data will still be available, as in desktops. However, if any changes are made, they won't be saved in the user's Google Account or synced to other devices. To turn off mobile sync, reopen Google Chrome, go to the controls menu (three vertical dots in the upper-right corner of the screen) and select «Settings». At the top of the screen, tap the user name. On the account page, scroll down and select Sign out of Chrome. In the system warning Disconnect from Chrome?» tap Sign out and Chrome synchronization will be disabled. Customize and manage synced data. Now that synchronization is available, you can access all the information stored in the linked in your account, such as bookmarks, browsing history, and open pages, protected passwords, autofill data, and so on. If you don't want to sync all data, or if you only want to select a specific type of data, you need to do a few steps— depending on the type of device you are using. Personal computers. On your trusted computer, open Google Chrome, and in the right corner of the address bar, click the Customize and manage Google Chrome button. In the context menu that appears, select «Settings». At the top of the page, look at the People tab and select Sync and Google Services. This allows you to access various sync settings. At the top of the page, find and select Manage syncing. On the new personalized settings page, click Sync All to change its status from on to disabled (its color will change from blue to gray), then turn on or off any data from the list for which you want to change the synchronization order by moving the switches to the appropriate position. To improve your privacy by storing information in Google's storage or syncing Your Chrome data, you can use special passphrases (which do not apply to payments and addresses in Google Pay). Additional password is not required because all synchronized data is always transferred via an encrypted channel. However, it is good to have another level of security. Once you create a passphrase, you may encounter some difficulties: The passphrase must be entered every time you are in a new location; You'll need to enter it on all devices that the app is entered from. You will not see suggestions from sites viewed on Google Chrome; The saved passwords panel will not be available for viewing; Your browsing history won't sync across all devices except for addresses actually entered in the Google Chrome address bar. To create a sync mode passphrase, sign in to Google Chrome and turn on sync as described earlier in this article. Open the application settings and on the Sync and Google Services page, go to «Encryption Options» and check the option «Encrypt synced data with your sync password. This does not include payment methods and addresses from Google Pay. As you do, some hidden fields are displayed, so enter the passphrase and confirm it, and then click Save to complete it. Now that sync is turned on and configured in the appropriate settings, you can view the information and payment data saved on other devices from Google Pay. For example, to manage bookmarks, click «Customize and manage Google Chrome» on the open menu, point to the «Bookmarks» line, and then select «Bookmark Manager» from the shortcut menu. Otherwise, use the keyboard shortcuts «Ctrl+Shift+O» to open this page immediately. On all devices, a list of synced bookmarks will appear on a separate page. By clicking on the «More actions» button (three vertical dots next to each bookmark) you will open a menu with a list of possible actions that you can do with each saved bookmark. Any changes made here will apply immediately, and the tags will be the same in all linked devices. Android» and «iOS» Devices.Note. Configuration procedure before The method of syncing or disabling «Chrome» is almost the same for «Android» and «iOS» mobile devices. Open Google Chrome on a trusted «Android» or «iOS» mobile device. In the upper-right corner of the screen, tap the button with three vertical dots to access the Google Chrome controls, and select «Settings» from the menu. On the Settings page, select a section with a user name. On the next page, click Sync if this is the current user account. The new sync settings page will display the types of data that is currently synchronized. Tap the switch next to Sync all to move it to the «off» position (the switch will turn from blue to gray). Now uncheck the boxes next to the data types that don't need to be synchronized, and leave only the options you need. To improve the privacy of your mobile device, you can choose to apply encryption and set an access password. On the Synchronization page, look below the data types and tap «Encryption». In the window that appears, select «Encrypt all synced data with your synced passphrase» instead of the default option «Encrypt passwords using Google credentials». When you do this, the system will ask for an access password and fill in the appropriate fields. When you do this, tap «Save» and the accessphrase will be applied. Now the selected data will be available from all user devices with the ability to manage them from any of these devices. For example, you can open its bookmarks, history, or other section in the Google Chrome main menu to access the saved data, or go to the settings page and select Save passwords. The new page will display a list of recorded secret phrases managed from a specific account. ConclusionThe information of development in a rapidly developing world has become very important, so timely and rapid access to it from any device can really save consumers time and improve the efficiency of their work. Many modern computer devices are forcing users to search for software that can perform current tasks and provide uninterrupted access to important user data at any time if necessary. One such product that can provide convenient «Internet» access, view internet resources and save all kinds of user data with direct access from any digital devices running different operating systems is Google Chrome. In order to create a Google Account, users can not only use all of this company's products, but also (by applying certain settings) to manage, modify, save, and view their data from any device. With the tips in this article, you can turn on syncing all devices with Google Chrome, configure the types of data that will be synced across devices, and to process such data from any device. If necessary, you can turn off sync or set up an additional passphrase to improve the protection of your data. In sync mode between different devices, it is easier to use information, you don't need to create additional copies of specific data, and user data is very mobile and protected on Google's servers. Servers.
